Alzheimer's disease and related dementias (ADRD) prevalence by county

Overall prevalence

Top 25 counties with highest ADRD prevalence among:

Conventional AD Rx

- Not very effective or well tolerated

2023 Therapeutics for Dementia

- Linked to Brain Imaging (***Theranostics***)
 - Monoclonal antibodies against beta amyloid
 - Shown by PET to decrease beta-amyloid
 - Lecanemab 2023 FDA approval
 - Slowed down worsening
 - Inflammation PET
 - Has encouraged immunomodulation trials

Multimodal Imaging in Alzheimer's Disease

Patient with
Alzheimer's Disease

Healthy
Elderly

Imaging Modalities for Neurodegenerative Dementias

□ MRI

- Volume (atrophy)
- Anatomical (DTI) & functional connectivity (BOLD)
- Blood flow (ASL)

□ PET (Positron Emission Tomography)

- Metabolism
- β -amyloid load
- ρ Tau load
- Inflammation

□ SPECT (Perfusion)

Metabolism (FDG) PET

□ Regional pattern (space)

Alzheimer Disease (**AD**) Frontotemporal Dementia (**FTD**)

□ Disease stage (time)

LEADING MEDICINE

A young woman with dark hair in a ponytail is seen from the side, supporting an elderly woman with short grey hair and glasses. The elderly woman is holding a black cane and looking towards the younger woman with a slight smile. The background is a softly lit indoor space with a lamp and some plants.

Alzheimer's is not a disease,
but a process

Stages of AD in Mice

Stages of AD in Patients (Imaging)

Inflammation

Beta Amyloid Tracers

F18

Commercially available

- Amyvid™ (florbetapir),
- Neuraceq™ (florbetaben)
- VizamyI™ (flutemetamol)

For clinical trials only

- NAV-4694 (flutafuranol)

C11

- PIB

Facts Supporting the Existence of an “Amyloid-Independent” Stage in Humans

1. Cognitive impairment linked to tau, not amyloid
2. Tau spreads in a prion-like fashion across natural brain networks
3. Amyloid trials in the “tau-stage” have failed to slow down progression

(1) Cognitive
impairment is linked
to tau, not amyloid

Cognitive Impairment is Linked to Decreased Brain Metabolism

Brain Metabolism
Is Depressed Where
Tau is High

Logopenic Aphasia (Alzheimer disease)

- Areas of normal metabolism 
- Have no tau 
- But areas with high amyloid 
- May have normal metabolism
- Areas with high tau 
- Have reduced metabolism 

**Tau more closely linked
to neurodegeneration
than amyloid**

Metabolism ^{18}F -FDG 57-year-old woman Amyloid ^{18}F -florbetapir Tau ^{18}F -flortaucipir

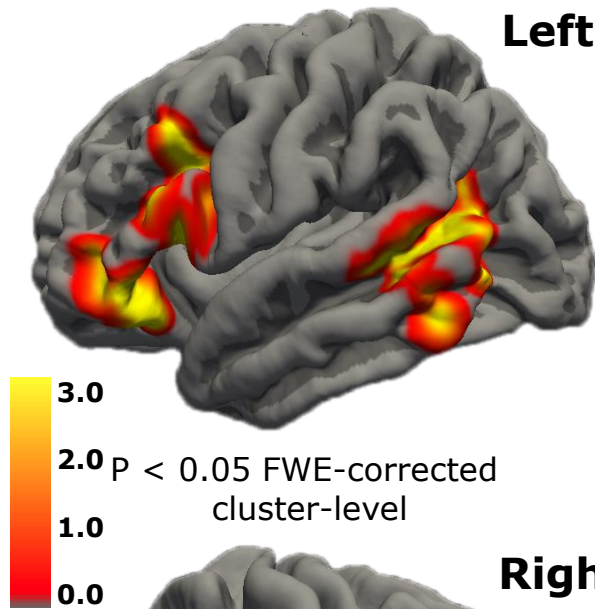

(2) Phosphorylated Tau
Propagates
Along Natural Brain Networks

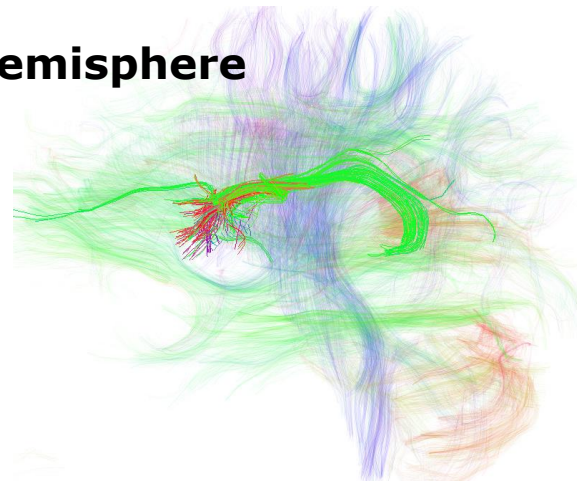

Tau deposits in anterior and posterior neuronal nodes of the syntactic network

These neuronal nodes are connected by the arcuate fasciculus, abnormal near the anterior node, where the disease begins

¹⁸F-AV1451 Tau PET in Non-fluent Primary Progressive Aphasia (nfvPPA)

Arcuate Fasciculus Tractography

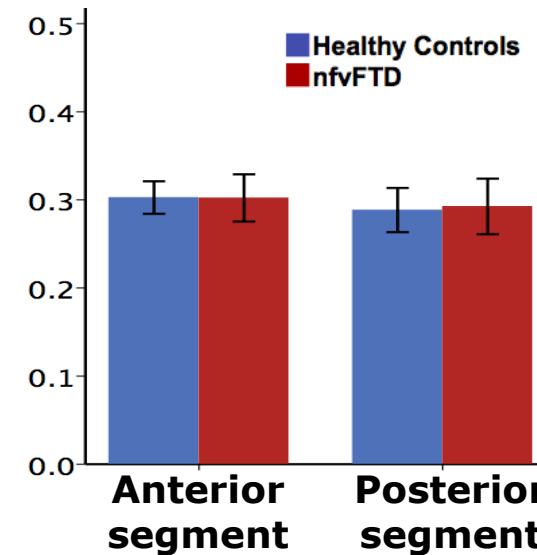

Right hemisphere

Pascual et al. *JNM*. 2020

Fractional Anisotropy of Arcuate Fasciculus

(3) Amyloid trials in the
“tau-stage”* have failed to
slow down progression,
but

*Amyloid-independent stage

Alzheimer's Drug Slows Cognitive Decline in Key Study

Biogen and Eisai reported the finding from a large late-stage clinical trial of lecanemab, a drug they are developing.

Give this article

70

In January 2023, the FDA approved the first medication that slows the progressive AD worsening

Anti-Amyloid Antibody Alzheimer Rx Trials

PET: do candidates have abnormal $A\beta$ deposition in the brain?

■ Those having abnormal $A\beta$ are randomized

■ Treatment or placebo

PET tau load as a secondary end-point

People being followed

■ Cognitively normal at risk

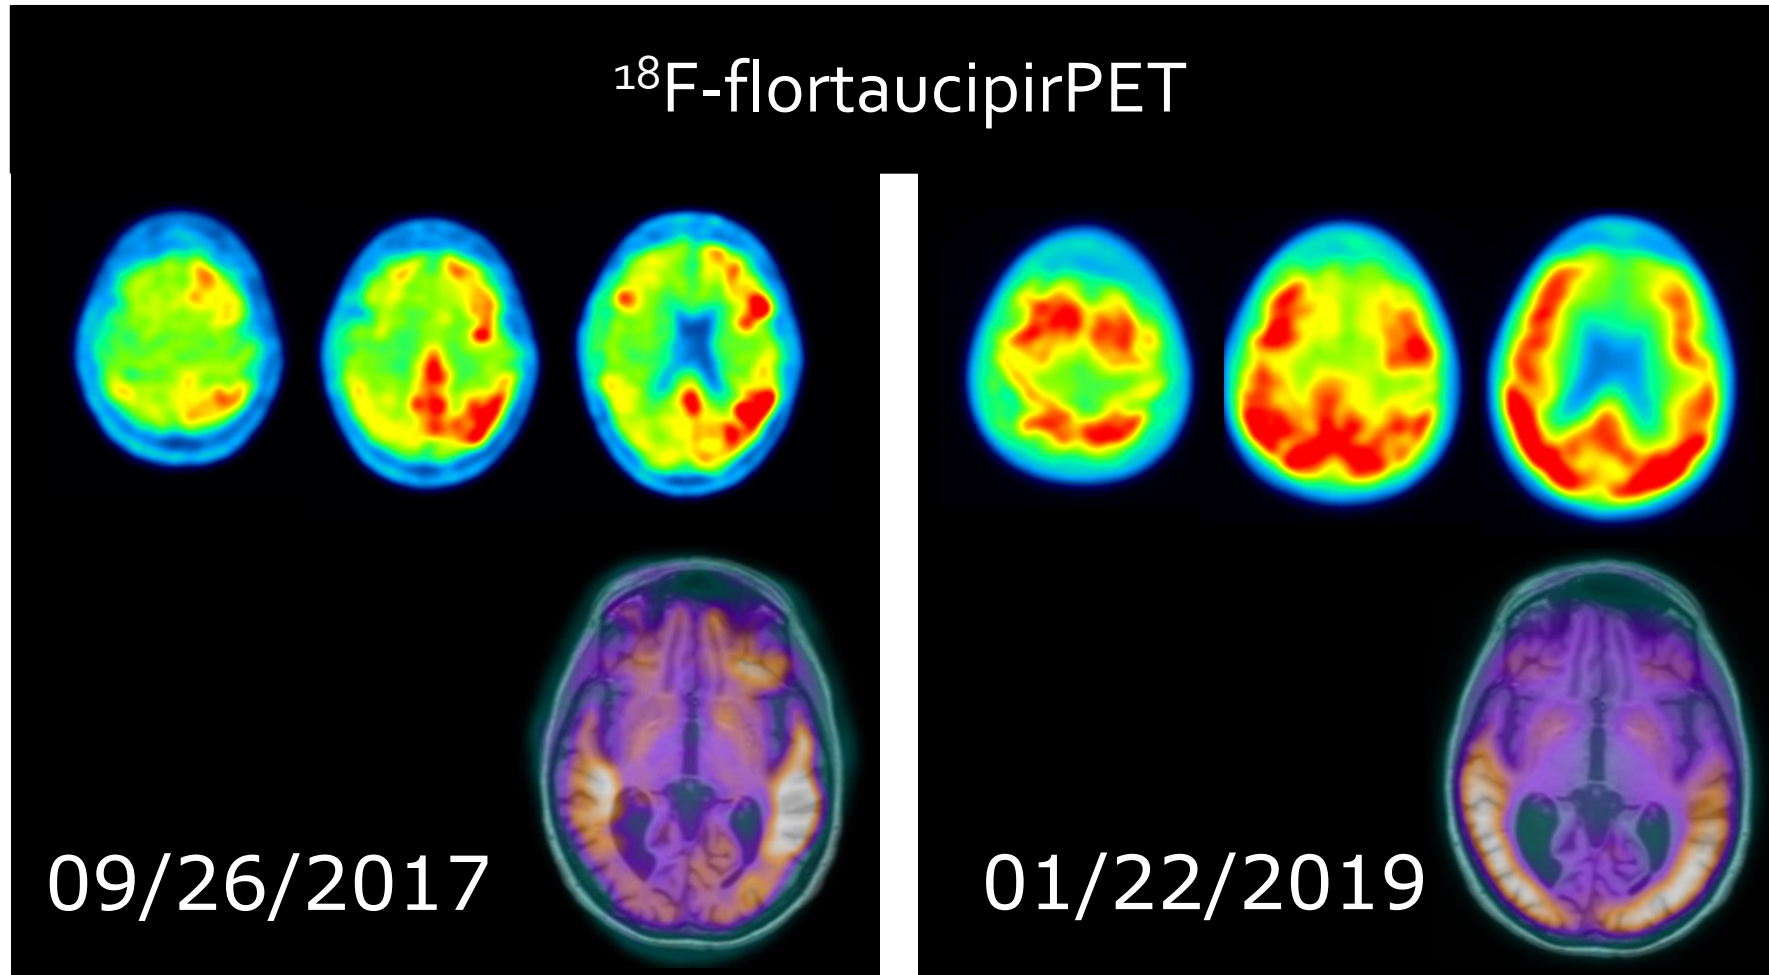

Solanezumab, IV (A4 trial, for people 65-85): Not effective (March 2023)

Lecanemab, IV (AHEAD trial, for people 55-80)

■ Mild cognitive impairment

Donanemab, IV (for people 50-85)

Using tau PET as Secondary Outcome

Clear-cut, quantifiable worsening in about 15 months

[¹¹C]MK-6884 PET tracer for M4 muscarinic receptors
First in-human patient study was done at HMRI

NeuroInflammation Modulation in Alzheimer's Disease (AD) and FrontoTemporal Dementia (FTD)

- The 18 kDa translocator protein (TSP0) is expressed by
 - Activated microglia
 - Astrocytes
 - Endothelial cells
- TSP0: most frequent target of inflammation imaging
 - Using positron emission tomography (PET)

- ^{11}C -(R)-PK11195 (introduced in 1986)
 - Low specific binding to TSP0 (BP_{ND} : 0.5-0.8)
- “Second generation” tracers (introduced from 2007)
 - Binding affected by TSP0 rs6971 polymorphism (low-binders)
 - ^{11}C -PBR28 (1.2)
 - ^{18}F -DPA-714 and ^{11}C -DPA-714 (7.3, high radiometabolites)
 - ^{11}C -ER176 (4.1)
 - High TSP0 affinity, less radiometabolites, low-binders can be imaged

MAB

Intra-subject Correlation

- To account for interindividual variability in the brain topography of
 - Amyloid
 - Tau
 - Inflammation
- And the variability introduced by the three TSPO binding affinities

- ^{11}C -ER176 PET allows for the identification in MCI patients of neuroinflammation in regions known to be involved in the AD process
- Subjects with any TSP0 genotype could be studied
- The co-localization of neuroinflammation with tau was even higher than between amyloid and tau
- This finding highlights the importance of neuroinflammation as a key process in AD and as a potential therapeutic target

NeuroInflammation Imaging in Frontotemporal Dementia (FTD)

Courtesy of Dr. Belen Pascual,
Director, FTD Unit

HOUSTON
Methodist[®]
LEADING MEDICINE

- PET uptake highly focal, mostly in gray matter
 - Can be diagnostically useful in difficult cases
- Corresponds well to the clinical phenotype
 - Behavioral variant FTD
 - Non-fluent primary progressive aphasia (nfvPPA)
 - Semantic variant primary progressive aphasia (svPPA)
 - Inflammation greater in the periphery than in the core of damage

Behavioral variant FTD (50 y/o woman)

^{18}F -SMBT-1 PET to Image Astrogliosis in AD

- In collaboration with Prof. N. Okamura and Dr. R. Harada
 - Tohoku University School of Medicine, Sendai, Japan
- SMBT-1 has high and specific binding affinity to MAO-B (Kd = 3.7 nM), expressed by astrocytes
- ^{18}F -SMBT-1 binding was elevated in AD vs controls
 - Consistent with regional brain density of MAO-B in humans
 - Displaceable by selegiline

^{18}F -SMBT-1 PET images in healthy control and AD patient (60-90 min post injection)

75 yo F, MMSE 21

- V. Villemagne

- Inflammation imaging is beginning to show patterns in the progress of dementia, but more work is needed
- Although limited by both cell and state specificity, TSPO imaging is helpful in depicting areas of brain inflammation in dementia
 - And in damage propagation/neuroprotection
- Additional imaging targets, with greater state and cell specificity are being developed

- The anatomical pattern of PET changes separates:
 - Alzheimer's disease (R3-R4 tau)
 - Diffuse Lewy-body disease (alpha synuclein)
 - Frontotemporal dementia (R4 tau, TDP-43)
- PET over time defines the type of therapy
 - Amyloid
 - Tau
- Active research on immunomodulation thanks to PET
